

The collective is identified with the persistent interior, not a frozen set of boundary variables. Interior nodes $\{1,2,3\}$ (blue, ringed) are fixed throughout; the screening boundary (orange) is re-inferred and changes identity as z sweeps $-1 \rightarrow +1$.

$z = -1$ (boundary $\{4,5\}$)

$z = 0$ (boundary $\{4,5,6\}$)

$z = +1$ (boundary $\{5,6\}$)
