

Phenotype-only vs. coordinated control, and sensitivity to the u_z cost weight

Row 1: baseline ($\rho_z=1$), averaged over formulations A-D

Row 2: ρ_z sensitivity (coordinated control only; formulations A-D averaged)

$T=1.0$: does penalizing u_z erase coordinated control's advantage? $T=2.0$: does penalizing u_z erase coordinated control's advantage?
